

for future expansion due to its location adjacent to a tobacco processing plant. At the present, the Public Works Garage does not allow adequate space for storage of city vehicles especially when other vehicles, such as the Recreational Department vehicles, are maintained and kept overnight. A more ideal and perhaps a more feasible location for the public works garage would be in the area near or adjacent to the power plant where the water and sewer plant operations offices are located.

Sewer service is offered to all areas within the corporate limits of Kinston. Since 1960, the major direction of sewer service expansion has been to the northwest of Kinston primarily for new residential development. A planned new sewage treatment plant to be located in the area west of N. C. 11-55 north, will double the sewage treatment capacity of Kinston. The location of this new plant should allow service to be expanded to the northeast areas of Kinston and to the eastern areas of the Kinston one mile fringe area. Present treatment capacity is 6.25 million gallons per day and projected treatment capacity would be approximately 12.5 million gallons per day capacity upon completion of the new plant.

The 1965 Ground Water Resources Report by the North Carolina Department of Water Resources recommended that due to the demand placed on the current source of water that the City of Kinston is using, future water well locations should be south and southwest of the corporate limits across the Neuse River. Following this recommendation would enable the City to provide water service to many areas of the southern planning fringe.
